# Implementing Client-Side Controls

Enforcing Data Integrity via UI Policies and Client Scripts on Incident Management

---

MODULE
Incident Management

FOCUS
UI Policies & Client Scripts

STATUS
Verified & Deployed

EXECUTIVE SUMMARY

# Problem Statement & Objective

### Operational Challenge

Inconsistent manual data entry creates critical gaps in Incident triage, breaches SLA requirements, and skews service reporting metrics.

### Target Solution

Deploy browser-level validation rules to dynamically restrict edits, enforce mandatory fields, and ensure mandatory assignments.

TECHNICAL ARCHITECTURE

# Client-Side Control Mechanisms

### UI Policies

Declarative rules for field visibility, read-only status, and mandatory conditions.

### Client Scripts

Custom JavaScript logic targeting onChange, onSubmit, and onCellEdit events.

### Execution Priority

Client scripts trigger first, followed by UI policies overrides for seamless UI UX.

TASK 1 & 2 OVERVIEW

# UI Policy: High Impact Control

### Condition Trigger

Impact field set to **1 - High**

### Assignment Group Action

Mandatory status set to **True**

### Urgency Field Action

Read-only status set to **True**

TASK 3 IMPLEMENTATION

# Automated Urgency Set (onChange)

```
function onChange(control, oldValue, newValue, isLoading) {
    if (isLoading || newValue == '') {
        return;
    }
    if (newValue == '1') {
        g_form.setValue('urgency', '1');
        g_form.addInfoMessage(
            'Urgency set to High for High impact incident.'
        );
    }
}
```

**Field Monitoring**

Triggers instantly upon modifying the Impact field.

**Immediate Feedback**

Outputs blue info banner confirming auto-calculated value.

TASK 4 IMPLEMENTATION

# Save Validation (onSubmit)

**Pre-Save Gatekeeper**

Blocks record submission if Assigned To field is missing on High Impact incidents.

**Field Error Box**

Directly highlights the Assigned To field with targeted warning text.

```
function onSubmit() {
    var impact = g_form.getValue('impact');
    var assignedTo = g_form.getValue('assigned_to');

    if (impact == '1' && assignedTo == '') {
        g_form.showErrorBox(
            'assigned_to',
            'Assigned To is mandatory for High impact incidents.'
        );
        return false;
    }
    return true;
}
```

TASK 5 IMPLEMENTATION

# List Edit Prevention (onCellEdit)

## Restricting List View Edits

Prevents users from bypassing business logic by modifying the State field directly in list view.

**Enforces Full Form View Execution**

```
function onCellEdit(sysIDs, table, oldValues, newValue, callback) {
    alert(
        'State cannot be changed from the list. ' +
        'Please open the incident.'
    );
    callback(false);
}
```

QUALITY ASSURANCE

# Testing & Verification Summary

| Test Scenario | Trigger Action | Expected Result | Status |
| --- | --- | --- | --- |
| **1. Mandatory Field** | Impact High, Assigned To empty | Submission blocked with error box | PASS |
| **2. Valid Record Save** | Impact High, Assigned To populated | Record submits successfully | PASS |
| **3. Reverse Condition** | Impact changed to Medium | Urgency editable, required flag cleared | PASS |
| **4. List Edit Prevention** | Double-click State in list view | Alert triggers & edit rolled back | PASS |

GOVERNANCE GUIDELINES

# ServiceNow Client Scripting Best Practices

### Avoid DOM Access

Use GlideForm API instead of direct HTML DOM calls.

### Declarative First

Prefer UI Policies over Client Scripts when possible.

### Specific Table Scope

Avoid global Client Scripts to preserve system speed.

### Async Server Calls

Leverage GlideAjax for non-blocking server queries.

PROJECT SUMMARY

# Elevating Data Quality Across the Incident Lifecycle

Client-side controls establish seamless compliance and ensure SLA commitments are fulfilled consistently.
